Electricity information relative to generation, transmission, distribution and end use of electric power.

Electricity can be generated in two main ways: by harnessing the heat from burning fuels or nuclear reactions in the form of steam (thermal ...

The electricity sector of Canada is dominated by clean energy sources, namely hydropower and nuclear energy.

Understand Canada's robust power grid. Discover its clean energy leadership, cross-border electricity trade, and the importance of standby ...

Overview Generation History Organization Transmission Provinces Climate change International trade In 2013, Canada generated 651.8 terawatt-hours (TWh), a 10% increase since 2003. Approximately 822 generating stations are scattered from the Atlantic to the Pacific, for a nameplate capacity of 130,543 MW. The 100 largest generating stations in Canada have a combined capacity of 100,829 MW. In comparison, the total installed capacity of Canada was 111,000 MW in 2000.

Many of us want an overview of how much energy our country consumes, where it comes from, and if we're making progress on decarbonizing our energy mix. ...

Data and analysis on energy use, energy efficiency and greenhouse gas emissions in the electricity generation sector in Canada. Compiled by Natural Resources Canada's Office of Energy Efficiency.

Canada's electricity mix includes 56% Hydropower, 15% Gas and 14% Nuclear. Low-carbon generation peaked in 1996.
