It gets all the elements from the list (or characters from a string) but the last element. `:` represents going through the list `-1` implies the last element of the list

The first, `[:]`, is creating a slice (normally often used for getting just part of a list), which happens to contain the entire list, and thus is effectively a copy of the list. The second, `list()`, is using the actual ...

can we have list comprehension without a for loop and just if/else to put a single default value inside the list and later extend it if required? i.e. `result = ["hello" if x == 1]`.

When reading, `list` is a reference to the original list, and `list[:]` shallow-copies the list. When assigning, `list` (re)binds the name and `list[:]` slice-assigns, replacing what was previously in the list. ...

and return a list of versions. Note: it seems to provide compatible releases rather than all releases. To get full list, use json approach from Eric.

This article is for finding public groups that end in `googlegroups`. To find groups in your work or school account, go to [Get started with Groups: Find and join a group](#). You can join a group to ha

Official Google Search Help Center where you can find tips and tutorials on using Google Search and other answers to frequently asked questions.

The notation `List<?>` means `"a list of something (but I'm not saying what)"`. Since the code in test works for any kind of object in the list, this works as a formal method parameter. Using a type parameter ...

I have a piece of code here that is supposed to return the least common element in a list of elements, ordered by commonality: `def getSingle(arr): from collections import Counter c = Counte...`
