The Solar System is the assembly formed by the Sun, eight planets (Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus & Neptune), their moons and other minor planets.

Our solar system is home to eight different planets that are classified into three different types: rocky planets, gas giants, ...

Our solar system has eight planets, and five dwarf planets - all located in an outer spiral arm of the Milky Way galaxy called the Orion Arm.

At the center is the Sun, composed mostly of hydrogen and helium and containing most of the solar system's mass. Next comes an inner system of four small planets (the terrestrial planets, Mercury, ...

A look at the compositions of terrestrial planets, gas giants, and ice giants in our Solar System.

The solar system consists of the Sun and those bodies orbiting around it: 8 (formerly 9) planets with about 170 known planetary satellites (moons).

The results of the determinations of the protosolar chemical composition, as well as the initial and present-day mass fractions of hydrogen, helium, and metals (X,Y,Z) for the solar system are ...

While the composition of gas and dust in a molecular cloud is fairly uniform, everything changes once a star begins to form. The Sun and planets of our solar system all formed from the ...

The three largest moons--Ganymede and Callisto in the jovian system, and Titan in the saturnian system--are composed half of frozen water, and half of rocks and ...
