The United States is adding 86 gigawatts of new power capacity in 2026, nearly double the previous year's total, according to data from the Energy Information Administration. Solar, wind, and ...

EIA reports U.S. developers plan to add 86 GW of power capacity in 2026, led by solar, battery storage, wind, and natural gas projects.

This is roughly the equivalent of adding China, the European Union and Japan's power generation capacity combined to the global energy mix. Solar PV ...

Solar, wind, and batteries are set to supply virtually all net new US generating capacity in 2026, according to the latest EIA data.

Renewables and storage are projected to account for 93% of all new utility-scale capacity this year. In contrast, natural gas developers plan to add only 6.3 GW of new capacity. With the 2026 ...

Designing a robust energy storage strategy requires more than simply expanding capacity--it demands rethinking the role, architecture, and integration of storage within the power ...

Few analyses so far offer comprehensive comparisons of forward-looking average and marginal capacity credits of variable renewable energy and storage in the U.S. across a wide range of possible futures.

This article addresses the complementary capacity planning of a wind-solar-thermal-storage hybrid power generation system under the coupling ...

This growth highlights the importance of battery storage when used with renewable energy, helping to balance supply and demand and improve grid stability. Energy storage systems ...

Wind and solar power generation storage capacity

Wind, nuclear, hydro, and solar together account for more than one-third of capacity. 468,582 MW of new generation capacity is under development in the United States, which is comparable to the total ...
